
Coating Process Optimisation

Integrating the coating process and coating selection with your production needs reduces costs, increases productivity and improves competitiveness. With our coating process optimisation programme we help you engineer a coating solution to match your production strategy.

The coating process is often a bottleneck for production. Safinah Group offers advice and services to enable you to optimise your coating processes. Our team has wide experience of painting processes in large scale manufacturing such as fabrication shops and yards, ship building as well as OEM and on-site application.

Our process improvement studies look at key factors that impact on:

- Pre-production activities
- Production processes
- Throughput rate
- End user needs
- Functional specification (goal-based)
- Provide short and medium terms improvement goals
- Assist your team on the ground with implementation

These factors all impact on productivity, costs and delivery and therefore the competitiveness of your business. Process optimisation can have other knock-on benefits including **reducing project overrun** and late penalty costs and **increased service level** to your customers as well as improved quality.
